

# New Brunswick Population and Demographic Counts

October 2021

Andy Balzer, MSc  
Ted McDonald, PhD  
Rawia Mokhtar, PhD

## **PROJECT TITLE**

New Brunswick population and demographic counts: October 2021

## **PRINCIPAL INVESTIGATOR**

Ted McDonald, Director, NB-IRDT

## **RESEARCH TEAM**

Andy Balzer, Data Analyst, NB-IRDT

Rawia Mokhtar, Research Projects Coordinator, NB-IRDT

## **PUBLICATION DATE**

December 2021

## **ACKNOWLEDGEMENTS**

Funding for this project was provided by the Government of New Brunswick, Department of Post-Secondary Education, Training and Labour (PETL) as part of a five-year research agreement between PETL and NB-IRDT. Data were accessed under an Information Manager Agreement with the NB Department of Health (DH). The views expressed in this study do not necessarily represent those of PETL, DH, or their partners.

## Summary

This report is the first in a series of semi-annual reports that will be published by the New Brunswick Institute for Research, Data and Training (NB-IRDT) in October and March of every year. These reports provide an overview of the New Brunswick (NB) population and changes that have occurred in the population since the previous reporting period. Timely data on population flows are useful for informing public policy across a range of areas, such as immigrant retention and mobility<sup>[1]</sup> and the mobility decisions of graduates from post-secondary education<sup>[2]</sup>. These updates also provide a robustness check on population estimates periodically reported by Statistics Canada.

## Highlight of Findings

- Of the **785,780** individuals living in NB as of December 15, 2020, **31,820** (4.05%) were immigrants.
- As of December 15, 2020, 7.48% of the population was aged 18-24, and 22.01% of the population was aged 65 and over.
- The immigrant age group with the largest population was aged 35-44, accounting for 23.21% of the immigrant population.
- 58.08% of the NB population lived in urban areas in Health Regions 1-3 (those containing Moncton, Saint John, and Fredericton) as of December 15, 2020.
- Monthly in-migration and net migration increased substantially from 2017 onward, with a maximum in-migration of 3,575 and net migration of 2,360 in the August-September 2019 migration period.
- Monthly immigrant in-migrations increased from 150 in January-February 2015 to 810 in January-February 2016, reflecting the arrival of a large cohort of Syrian refugees.
- Yearly in-migration increased from 12,320 in the 2015 migration period to 19,700 in the 2019 migration period.
- In-migrations for individuals with an Unknown previous province (mainly international arrivals) increased from 3,095 in the 2015 migration period to 8,220 in the 2019 migration period.
- In-migrations from Ontario increased from 2,740 in the 2015 migration period to 5,465 in the 2020 migration period.
- Out-migration from NB for individuals who had moved to NB previously from another province dropped from 8,875 in the 2013 migration period to 4,770 in the 2020 migration period.

## Discussion

Overall, we see several positive trends in the population of NB. The immigrant population in NB is small but growing. The age distribution of the NB immigrant population is younger on average than the age distribution of NB overall. In-migration to NB has increased in recent years, and this includes an increase of international immigration to NB. Residents from other provinces are also becoming increasingly likely in recent years to move to NB and decreasingly likely to subsequently move out of NB. It is also notable that NB continues the trend towards increased urbanization, which also has significant policy implications for regional economic development.

## Introduction

NB-IRDT has previously produced reports on immigrant retention<sup>[1]</sup> and student retention<sup>[2]</sup>, in collaboration with the New Brunswick (NB) department of Post-Secondary, Education, Training, and Labour (PETL). These reports provide information to government about how many immigrants and student graduates are staying in the province, which can then inform policy around immigration and post-secondary education. Underlying both reports are data on the population of NB and how that population shifts over time. A more detailed exploration of population and migration in NB will provide more insight into how further research on retention and population can better inform government policy.

This report is the first in a new series of reports NB-IRDT will be producing on a bi-annual basis on the composition of and changes in the NB population. The analysis uses changes in Medicare status based on a prepared version of the Medicare Registry called the Citizen Database, accessed through NB-IRDT's secure lab facilities.

The objectives of these reports are to measure

- The total population count of New Brunswick by different demographic and geographic characteristics.
- The magnitude of interprovincial inflows and outflows.

Accomplishing these objectives gives us detailed insight on population composition and migration trends in NB, which then informs further research on population dynamics in NB and, in turn, economic growth and development.

In this first report, we provide historical data on the NB population over the last ten years (2010 – 2020) as a benchmark for future updates.

Using the administrative Citizen Database to calculate population counts, inflows, and outflows has several strengths. For one, the database is reliable and valid. It shows actual counts, unlike Statistics Canada monthly estimates, which are imputations. It can also be linked with other databases to assess population trends across different subgroups and regions. Further, it allows for detailed sub-group analysis over time by region or by personal characteristics. In addition, individual-level data from the Citizen Database are available in a timely fashion, with the most recent records being based on registration in Medicare within a few months of receipt of the dataset.

It should be noted that these population reports rely only on Medicare registry data accessed under an Information Manager Agreement, and therefore some limitations should be noted. One is that unlike NB-IRDT's report on immigrant retention<sup>[1]</sup>, which used comprehensive immigration landing records from IRCC to determine immigration status, this report relies on citizen status as recorded in the Medicare system to determine immigration status rather than

IRCC records.<sup>1</sup> Another limitation is that data on the location of residence for people leaving NB are not available, which means province of destination cannot be specified in this report.

In the next section, we briefly describe the data and methodology used. We then present levels and changes in population size over the last ten years overall, and by a range of demographic characteristics. We then indicate reasons for why these estimates differ from what is reported by Statistics Canada in their periodic population updates.

## Data and Methodology

The current version of the Citizen Database at NB-IRDT (as of December 2021) contains all NB Medicare records from January 1, 1971, to January 31, 2021.<sup>2</sup> Individuals eligible for Medicare include almost all NB citizens and permanent residents, as well as temporary foreign residents on a one-year work permit or longer, and international students (from 2017 onward). Other NB-IRDT reports on immigrant retention<sup>[1]</sup> and student retention<sup>[2]</sup> describe the sample universe of the Citizen Database in more detail.

Eligibility records, included to calculate population counts, contain either an “Active,” “Inactive,” or “Terminated” status group. Individuals have an “Active” group status for periods when they have NB Medicare. They have a “Terminated” group status when Medicare coverage ends. And they have an “Inactive” group status for other non-active Medicare statuses, such as during the Medicare application process. In addition to status groups, the statuses “Left the Province” and “Left Country” within the “Terminated” status group were used in the calculation of out-migration rates.

For this report, the sample includes individuals with an “Active” Medicare status between December 15, 2010, through December 15, 2020.

Population counts are presented as of December 15, 2020, and all individuals with an “Active” NB Medicare status on that date are included in the population counts.

Demographic information about individuals was taken from the Registry table in the Citizen Database. In cases where an individual had more than one Registry record, the most recent record was used.

The age categories “0-17,” “18-24,” “25-34,” “35-44,” “45-54,” “55-64,” and “65+” were included based on the individual’s age as of December 15 of a given year.

---

<sup>1</sup> Analysis of linked IRCC-provincial data is the subject of annual immigrant retention reports produced by NB-IRDT. These reports are available at <https://www.unb.ca/nbirdt/research/publications/index.html>.

<sup>2</sup> Although Medicare registry data are available as recently as two months prior to the current date, we restrict consideration to calendar year 2020. In confirming out-migration status, we need a ‘look-forward’ period of six months to ensure that apparent out-migration is not in fact simply a failure to renew one’s Medicare card.

The genders “Male” and “Female” were included, with “Unknown” gender records removed to protect the confidentiality of certain individuals because of small sample sizes associated with that gender category.

Immigrant status was determined based on an individual's citizen status and previous country as reported in the Citizen Database.<sup>3</sup> Individuals were assigned “Immigrant” status if they had a “Landed Immigrant” citizen status or had both an “Unknown” citizen status and a non-Canadian previous country of residence (this may include some temporary residents). All other individuals,<sup>4</sup> including those with a “Permit” citizen status, were assigned “Non-immigrant” status.<sup>5</sup> Note that immigrants who were Canadian citizens before moving to NB were assigned a “Non-immigrant” status based on this categorization. Future work will consider more disaggregated categories of residents who are neither citizens nor permanent residents.

Geographic information on individuals was determined based on the most recent geographic record for that individual on or before December 15, 2020. Geographic categories include health region and an urban/rural indicator where urban is defined as the urban area within one of the seven health regions of New Brunswick.<sup>6</sup>

Migration counts were calculated based on transitions of Medicare status for each month/year between December 15, 2010, through to December 15, 2020. Each migration count used a time interval that indicated an individual's Medicare status at two points in time – a start date and an end date – and then counted in-migrations or out-migrations based on changes between the start date and end date. For example, the June-July 2011 monthly migration count would indicate an individual's status on June 15, 2011, and July 15, 2011; and it would include in-migrations or out-migrations depending on changes in status that occurred from one time point to the next. We created 120 monthly intervals and ten yearly intervals for the migration counts in this report.

An in-migration was counted if an individual did not have an “Active” status on the start date (or six months prior to the start date) but did have an “Active” status on the end date. NB births were excluded from in-migration counts.<sup>7</sup>

---

<sup>3</sup> As this report uses only the Citizen Database, administrative data on immigrant landing records from IRCC are not included. Upcoming reports on immigrant attraction and retention, which will be published annually each spring, make use of the linked dataset.

<sup>4</sup> This includes individuals with a citizen status listed as “Canadian,” “Dual Citizen,” “Permit,” or “Status Indian,” as well as “Unknown” Citizen Status with “Canadian” previous country.

<sup>5</sup> Future iterations of this report can consider population counts of individuals on permits separately from other residents.

<sup>6</sup> These seven urban areas are larger in scope than the seven CMA/CAs of New Brunswick since they encompass any areas designated as urban within the health zones.

<sup>7</sup> Counting NB births in the Citizen Database was complicated by two factors. First, there can be a delay of a few months between when someone is born in NB and when their Medicare status becomes “Active.” Second, it is difficult to differentiate between cases where someone is born in NB and obtains an “Active” Medicare status a few months later versus cases where someone was born outside NB but moves to NB within the first few months after birth. To resolve this, time intervals were marked as in-migrations, and we then checked if the individual was born within six months of that time interval. In applicable cases, we checked if the primary parent of that individual had an “Active” NB Medicare status on the individual's date of birth. Cases where the parent was “Active” were no longer counted as in-migrations. For cases where the parent's status was unknown, applicable individuals with “New Brunswick” as their previous province were no longer counted as in-migrations.

An out-migration was counted if an individual had an “Active” status on the start date but did not have an “Active” status on the end date (and six months after the end date – or on December 15, 2020, if that came earlier). The six-month period after the end date is important, as Medicare status may be terminated for various reasons other than leaving the province. For example, one could neglect to renew Medicare coverage when one’s current Medicare card expires.

Out-migration excludes cases where a date of death occurred between the start date and end date.<sup>8</sup> Out-migrations were counted if an individual did not have either a “Left the Province” or “Left Country” status on the start date but did have one of those two statuses on the end date. These “Left the Province” or “Left Country” out-migrations were counted regardless of other status changes during that time period.

Immigrant status was included in the monthly migration counts based on criteria specified previously.

In this report, “Previous Province” was used for yearly migration counts to show where individuals resided before migrating to NB. Previous province is the most recent province where an individual was registered for Medicare prior to registration for Medicare in NB. The three territories (“Yukon,” “Northwest Territories,” and “Nunavut”) were combined into one “Territories” category due to small sample sizes.

NB Medicare data do not reliably record province of destination for out-migrants with sufficient accuracy for us to report statistics on destination of out-migration.

It is important to note that health insurance regulations in most provinces specify a three-month waiting period before an interprovincial mover can apply for host province health insurance. Thus, the dates of in- and out-migration of interprovincial movers may involve a three-month lag between the actual date of the move and the date of health insurance registration. This is not the case for international arrivals, who are generally eligible to apply for health insurance on arrival in the host province.

For the counts presented in tables, we used a mix of random rounding and controlled random rounding, both of which randomly rounded to base 5 to protect the confidentiality of small sample sizes. Random rounding was used for tables with geographic area type. Controlled random rounding was used for all other tables.

---

<sup>8</sup> Date of death was based on the effective date an individual obtained the “Death” eligibility status (a sub-category of the “Terminated” status) in the Citizen Database.

## Population Profile

The population profile in this report is based on the number of individuals who had an active NB Medicare status on December 15, 2020. These counts were categorized by age, gender, immigrant status, health region, and urban/rural status.

Figures are presented throughout the report, and corresponding tables of counts are in the Appendix. It is important to note that “Immigrant” is defined to include permanent residents only, based on Medicare citizenship status. Thus, non-permanent resident immigrants are included as non-immigrants. The next iteration of this report will consider this group separately.

Table 1 shows the New Brunswick population, based on active Medicare status on December 15, 2020, organized by immigrant status.

**Table 1: Population on December 15, 2020, by Immigrant Status**

Status	Population	% of Population
Immigrant	31,820	4.05
Non-Immigrant	753,960	95.95
<b>Total</b>	<b>785,780</b>	<b>100.00</b>

## Population by Age and Gender

Figure 1 shows population counts by age group and gender as of December 15, 2020. Table 2 in the Appendix has the corresponding counts for this figure.

**Figure 1: Population on December 15, 2020, by Age and Gender**

The population in Figure 1 rises as the age increases, from 58,815 individuals aged 18-24 (7.48% of the population) to 172,965 individuals aged 65 and over (22.01% of the population). The gender distribution is generally split evenly, with 387,360 males (49.30% of the population) and 398,420 females (50.70% of the population).

The largest difference was among individuals aged 65 and over. This group had 80,575 males (46.58% of the age group) and 92,390 female individuals (53.42% of the age group).

### Immigrant Population by Age and Gender

Figure 2 shows population counts by age group and gender specifically for individuals with “Immigrant” status as of December 15, 2020, with corresponding numbers in Table 3.

**Figure 2: Immigrant Population on December 15, 2020, by Age and Gender**

In Figure 2, the immigrant population age group with the highest number of individuals was the 35-44 age group, containing 7,385 individuals (23.21% of the immigrant population).

This is different from Figure 1, which shows more individuals in older age categories.

The gender distribution is similar among both the immigrant population and the total population, with the immigrant population made up of 15,620 males (49.09% of the immigrant population) and 16,200 females (50.91% of the immigrant population). The largest difference is for immigrants aged 25-34. This group had 2,530 males (47.16% of immigrants aged 25-34) and 2,835 females (52.84% of immigrants aged 25-34).

## Population by Geographic Area

Population counts were also calculated by health region and urban/rural indicator. The urban/rural indicator defines urban as within the urban area of one of the seven health regions of New Brunswick. Counts as of December 15, 2020, are shown in Figure 3, with corresponding numbers in Table 4.

**Figure 3: Population on December 15, 2020, by Health Region and Urban/Rural Indicator**

\*"Urban" is defined as within the urban area of one of the seven health regions in NB. Health regions are labelled based on the largest city or town in that region.

The population in Figure 3 is concentrated in the urban areas of health regions that include the three largest cities in NB: Moncton, Saint John, and Fredericton.

There were 198,395 urban individuals in the health region containing Moncton, 133,775 in the region containing Saint John, and 123,425 in the region containing Fredericton, for a total 455,595 individuals, or 58.08% of the wider population.

The Bathurst health region had 42,910 rural individuals, making it the health region with the highest proportion of rural individuals, at 54.59%. Conversely, the Miramichi health region had 2,955 rural individuals (individuals outside the Miramichi urban area), making it the health region with the lowest proportion of rural individuals, at 6.73%.

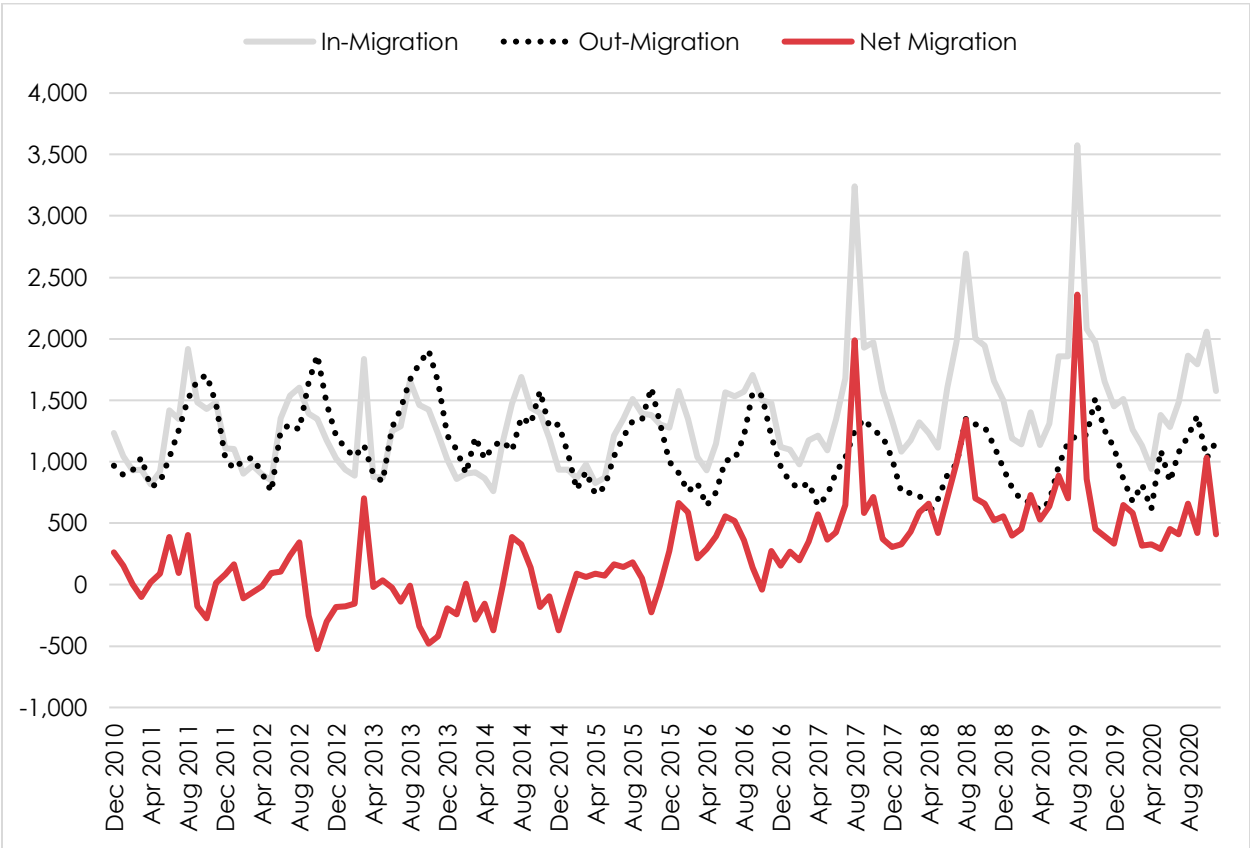

# Migration To and From New Brunswick

Migrations to and from NB include all migrations, both domestic and international, that meet the migration criteria specified in the methodology section. The migration counts use monthly migration periods, which are further categorized by immigrant status, as well as yearly migration periods, which are further categorized by previous province.

## Monthly Migration

Figure 4 shows in-migration and out-migration for each month in the ten-year period between December 15, 2010, and December 15, 2020, with corresponding migration counts in Table 5.

**Figure 4: Migration by Month from December 15, 2010, to December 15, 2020**

\*The data points presented indicate the counts as of the 15<sup>th</sup> day of each month.

The in-migration and out-migration counts in Figure 4 both show seasonal trends with more migration activity in the second half of each year (July – December) compared to the first half (January – June).

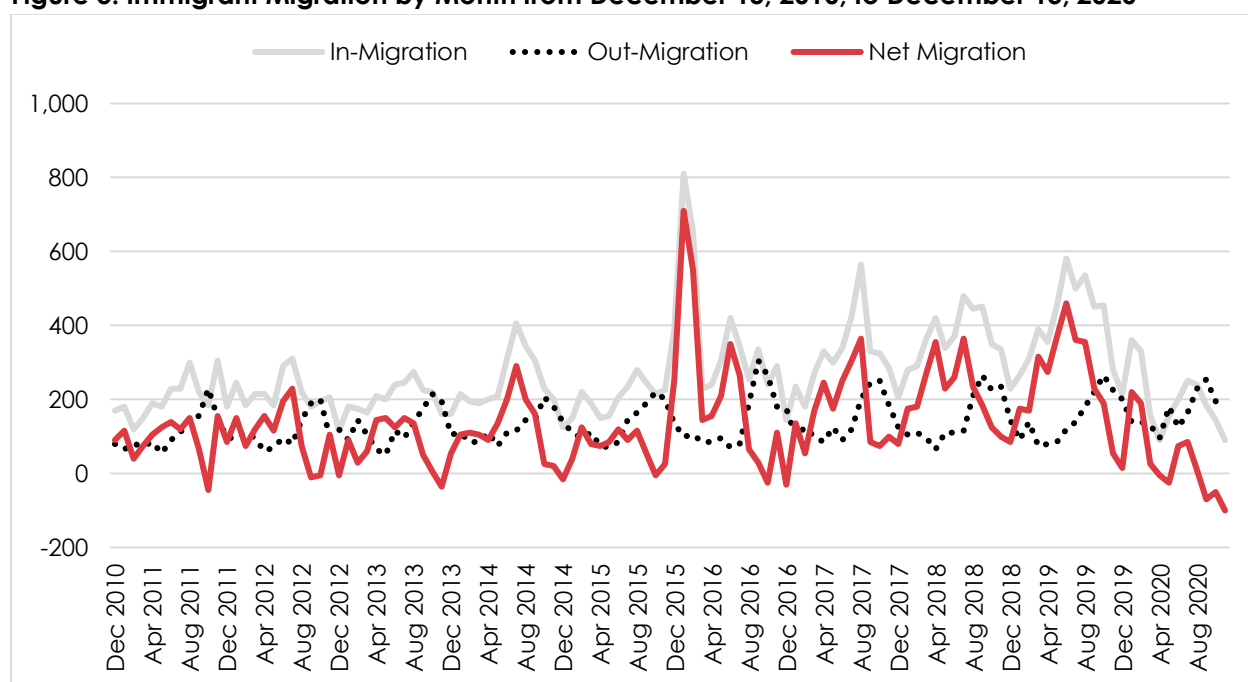

In-migration and out-migration were at similar levels up until early 2017, at which point in-migrations increased above out-migrations. In-migration and net migration increased significantly in the second half of 2017, with spikes in in-migration each year afterward. The

highest level of in-migration was in the August-September 2019 migration period, with 3,575 reported in-migrations and 2,360 net migrations.

## Immigrant Monthly Migration

Figure 5 shows in-migration and out-migration counts by month over the last ten years (2010 – 2020), specifically for individuals with “Immigrant” status, with corresponding migration counts in Table 6. Note that “Immigrant” is defined as individuals who were permanent residents on arrival in NB.

**Figure 5: Immigrant Migration by Month from December 15, 2010, to December 15, 2020**

\*The data points presented indicate the counts as of the 15<sup>th</sup> day of each month.

The trends in Figure 5 are similar to those shown in Figure 4, but with a significant spike of in-migrations in the January-February 2016 migration period. There were 810 in-migrations in the January-February 2016 period, which is a significant increase from 150 in-migrations in January-February a year prior. This was due primarily to the arrival of Syrian refugees in NB in 2016, as mentioned in the NB-IRDT report on immigrant retention.<sup>[1]</sup>

Note that, due to the small immigrant population in NB, the spike of immigrant in-migrations in early 2016 did not produce as much of a spike for the same time period of the overall monthly migration counts in Figure 4.

## Yearly Migration

Figure 6 shows in-migration and out-migration counts by year in the ten-year period between December 15, 2010, and December 15, 2020, with corresponding migration counts in Table 7.

Each of the yearly periods presented go from December 15 of one year to December 15 of the following year. This report uses the end year to report on the migration period. For example, the 2011 migration period goes from December 15, 2010, to December 15, 2011.

**Figure 6: Migration by Year from December 15, 2010, to December 15, 2020**

The yearly migration trend in Figure 6 matches the monthly migration trend shown in Figure 4, but with less granularity. In-migrations increased from 12,320 in the 2015 migration period to 19,700 in the 2019 migration period. In-migrations then decreased to 16,750 in the 2020 migration period, likely due to COVID-related reasons.

Out-migrations steadily decreased from 14,985 in the 2013 migration period to 11,020 in the 2020 migration period.

### Yearly Migration by Previous Province

The yearly migration counts presented above are further categorized by previous province in the next two figures. Figure 7 shows in-migrations by previous province, and Figure 8 shows out-migrations by previous province. These migration counts are also listed in Table 7.

As previously mentioned in the methodology, NB Medicare data do not reliably show province of destination after leaving NB. This means yearly out-migration counts in this report do not show province of destination after leaving NB but do identify the previous province the individual came from before arriving in NB.

For example, if an individual were to come from Alberta to NB and then leave for Ontario, they would be counted as both an in-migration and out-migration with a previous province of Alberta, but the report would not show Ontario as a province of destination.

**Figure 7: In-Migration by Year from December 15, 2010, to December 15, 2020, by Previous Province**

Figure 7 shows a large increase of in-migrations for individuals whose previous province was Unknown – from 3,095 in-migrations in the 2015 migration period to 8,220 in-migrations in the 2019 migration period. The Unknown previous province category primarily includes immigrants arriving from other countries, but it also includes individuals with Unknown previous province due to other reasons, such as gaps in Medicare coverage.<sup>9</sup>

In-migrations from Ontario also increased significantly from 2,740 in-migrations in the 2015 migration period to 5,465 in-migrations in the 2020 migration period.

Figure 8 shows yearly out-migrations by three previous province categories: First Time Leaver, Province Outside NB, and Unknown.

First Time Leavers are out-migrants with NB as their previous province. These are individuals from NB who had not moved out of the province prior to that out-migration.

Out-migrations with any previous province outside NB make up the Province Outside NB category and include individuals who previously moved to NB from another province.

Out-migrations with Unknown previous province make up the Unknown category and are primarily immigrants who previously moved to NB from another country.

<sup>9</sup> Specifically, in-migrations with NB as previous province are included in the Unknown category since these in-migrations are generally a result of gaps in Medicare coverage. For example, if someone from NB moved to Ontario and then back to NB, but didn't register for Ontario Medicare during their time there, their previous province would say NB, rather than Ontario. Other cases like these leave no information about where the individual was during their time outside NB, making their previous province "Unknown."

**Figure 8: Out-Migration by Year from December 15, 2010, to December 15, 2020, by Previous Province**

Figure 8 shows a 46.25% drop in out-migrations for individuals previously from a province outside NB over a seven-year period – from 8,875 in the 2013 migration period to 4,770 in the 2020 migration period.

Out-migrations from individuals with an Unknown previous province increased throughout the ten-year period but did not match the increase of in-migrations of individuals with an Unknown previous province in Figure 7. This had the effect of a net migration gain over time in this group, which is largely comprised of international immigrants.

## Conclusion

This report used NB Medicare information from the Citizen Database to give a population snapshot as of December 15, 2020, including both monthly and yearly migration counts from December 15, 2010, to December 15, 2020.

This population snapshot shows that while the population of NB is aging, the immigrant population within NB has an age distribution more centered around the 35-44 age category. As well, more than half the NB population live in urban areas within the three largest health regions containing Moncton, Saint John, and Fredericton, respectively.

The migration counts show increasing in-migration and net migration from 2017 onward, as well as a spike in immigrant in-migrations in early 2016. The monthly migration counts show a seasonal pattern where in-migrations and out-migrations both increased in the second half of each year. In-migrations from Ontario and outside Canada have increased since 2015. Out-migrations have decreased since 2013, particularly from individuals who were residents of another province prior to moving to NB.

Statistics Canada also reports on population and migration estimates using their own data and methodology. The population and migration counts in this report were compared to corresponding counts from Statistics Canada to ensure the validity of the results. The population counts in this report closely matched corresponding Statistics Canada population counts,<sup>10</sup> with a difference of less than 1%. This indicates the Citizen Database contains roughly the same population as Statistics Canada data, suggesting the robustness of each.

The yearly migration counts and trends were also broadly comparable to the ones reported by Statistics Canada,<sup>11</sup> though with more variation (but still less than 10% difference on average). These differences in migration counts can be explained by differences in methodology between how Statistics Canada measures migration<sup>12</sup> and how migration was measured in this report. Statistics Canada is able to provide province of destination, unlike the migration counts in this report, which only show previous province. Conversely, Statistics Canada is not able to provide actual monthly migration counts like this report did, but instead Statistics Canada provides monthly estimates through imputation.

This report was the first in a continuing series of semi-annual reports providing an overview of the NB population and changes to that population. Subsequent reports will use updates to the Citizen Database to update results on changes in the population.

## Appendix – Additional Tables

**Table 2: Population on December 15, 2020, by Age and Gender**

Age Group	Male	Female	Total
0-17	68,870	65,960	134,830
18-24	30,210	28,605	58,815
25-34	46,275	45,565	91,840
35-44	47,450	49,335	96,785
45-54	52,290	53,230	105,520
55-64	61,690	63,335	125,025
65+	80,575	92,390	172,965
<b>Total</b>	<b>387,360</b>	<b>398,420</b>	<b>785,780</b>

**Table 3: Immigrant Population on December 15, 2020, by Age and Gender**

Age Group	Male	Female	Total
0-17	3,100	3,020	6,120
18-24	1,270	1,235	2,505
25-34	2,530	2,835	5,365
35-44	3,515	3,870	7,385
45-54	2,655	2,615	5,270
55-64	1,595	1,570	3,165
65+	955	1,055	2,010
<b>Total</b>	<b>15,620</b>	<b>16,200</b>	<b>31,820</b>

**Table 4: Population on December 15, 2020, by Health Region and Urban/Rural Indicator**

Health Region	Rural	Urban	Unknown	Total
Moncton	27,830	198,395		226,225
Saint John	45,950	133,775		179,725
Fredericton	55,760	123,425		179,185
Edmundston	18,965	28,715		47,680
Campbellton	2,490	23,150		25,640
Bathurst	42,910	35,690		78,600
Miramichi	2,955	40,975		43,930
Unknown			3,405	3,405
<b>Total</b>	<b>196,860</b>	<b>584,125</b>	<b>3,405</b>	<b>784,390</b>

\*Urban is defined as within the urban area of one of the seven health regions in NB.

**Table 5: Migration by Month from December 15, 2010, to December 15, 2020**

Start Date	End Date	In-Migration	Out-Migration	Net Migration
2010-12-15	2011-01-15	1,235	970	265
